                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2490
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This is the nucleotide sequence of Herpes simplex virus ICP4 used in the method of the invention as modulators of apoptosis. The methods and products can be used to identify compounds which modulate (stimulate or inhibit) apoptosis in cells. They can be used to immortalise cells for the study of these cells or for growing cells in large numbers for the productions of proteins. They can also be used for stimulating apoptosis in cells, e.g. for treating a subject with a very information.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 4257 BP; 412 A; 1768 C; 1663 G; 414 T; 0

                                                                                The herpes simplex virus (HSV) alpha-4 gene encodes infected cell proteinumber 4 (ICP4). Both the alpha-4 gene and ICP4 can be used to block cell apoptosis. Similarly the administration of an agent that inhibits ICP4 or the alpha-4 gene can induce apoptosis in HSV infected cells. This can be used for the immortalisation of cells, production of proteins, gene therapy, or inhibition of cell death induced in vivo. They can also be used for production of therapeutics comprising inhibitors of HSV ICP4 function, useful for treating HSV function.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CDS

                                                                                                                                                                                                                                                                                                                                                                                                         The specification describes antisense oligonucleotides (AAX52869-X55271) directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences AAX55272-74. These multiple target oligonucleotides (specifically AAX55180-271) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and
                                                                                                                                                                                                                                                              inflammation, including lung diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis, acute asthma, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, pulmonary vasoconstriction, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g. colon cancer, breast cancer, lung cancer, pancreatic cancer, hepatocellular carcinoma, kidney cancer, melanoma, hepatic metastases, as well as all types of cancers which may metastasize
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Antisense oligonucleotide; multiple target; antisense treatmer impaired respiration; inflammation; lung disease; pulmonary vasoconstriction; inflammation; allergic rhinitis; acute asthma; allergy; asthma; impeded respiration; respiration; respiratory distress syndrome; pain; cystic fibrosis; pulmonary hypertension; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; leukemia; lymphoma; car colon cancer; breast cancer; lung cancer; pancreatic cancer;
                                                                                                                                                                                                                   Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  domains by altering the DNA that encodes the domains. The invention also describes a method for combining genes (or gene segments) that encode PPS modules that lack (A) with genes (or segments) encoding modules that lack (A) with genes (or segments) encoding modules that include (A). Modified DNA sequences formed by insertion of (A) are used (1) for altering natural (or already altered) PPS or polyketide synthetase (PKS) genes and their fragments, also for construction of new PPS and PKS gene and (ii) for construction of plasmids or genetically altered organisms for synthesis of encoded proteins (B). (B) are used for in vivo or in vitro enzymatic synthesis of amino acids, polypeptides, and peptidyl-acetyl mixed structures containing N-methylated amino acids, or their derivatives, also for fermentative production of such compounds.
                                                                                                                                                                                                            2043
                                                                                                                                                                                                                                                                                 2103

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents the BLM (Bleomycin) gene cluster, containing open reading frames (ORFs) 8-30. The proteins encoded by the gene cluster are useful for producing peptides and/or polyketide metabolites, especially bleomycin or bleomycin analogues. They are also useful for chemically modifying biological molecules to produce branched methyl groups, and for coupling amino acids and fatty acids. They may be reacted with an apo-carrier protein and coenzyme A to produce a holo-carrier protein. The BLM gene cluster or catalytic domains can be used individually or collectively to produce thiszolide, thiszoline, bithiszoline and bithiszoline-consaining

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         24111
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents the platenolide synthase gene cluster of the invention. This sequence is referred to as the srmG gene, and was isolated from Streptomyces ambofaciens. This sequence encodes the multi-functional proteins which direct the synthesis of the polyketide platenolide. Platenolide is the basic building block of the macrolide antibiotic spiramycin. The DNA can be used to produce compounds exhibiting antibiotic activity based on the platenolide structure, including specifically the macrolide antibiotic spiramycin and spiramycin analogues and derivatives. Modifications of the platenolide synthase DNA sequence can be made so as to change the number and type of carboxyllc acids incorporated into the growing polyketide chain and to change the kind of post-condensation processing that is conducted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 44377 BP; 4965 A; 15552 C; 17381 G; 6479

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           24171
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    24231
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       gene is the tylactone synthase gene cluster of the invention. The tyld sequence was isolated from Streptomyces fradiae, and encodes multifunctional proteins which direct the synthesis of the polyketide tylactone. Tylactone is the basic building block of the antibiotic tylosin. The hybrid sequence can be used to transform S. ambofaciens lacking the srmG ORF1 sequence, or S. fradiae lacking the tylG ORF1 sequence, so that they can produce polyketides. The DNA sequence can be sequence, so that they can produce polyketides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents the platenolide synthase gene cluster of the invention. This sequence is referred to as the srmG gene, and was isolated from Streptomyces ambofaciens. This sequence encodes the multi-functional proteins which direct the synthesis of the polyketide platenolide. Platenolide is the basic building block of the macrolide antiblotic spiramycin. This sequence was used along with the ty1G gene (see AAT80413) to create a hybrid ORF1 sequence (see AAT80415). The ty1G
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 modified so as to alter the type of carboxylic acids incorporated, t number of carboxylic acids incorporated and/or the post-condensation reactions performed, thereby resulting in novel tylosin-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 44377
